

FoodStore

E-Commerce Platform

A full-stack food ordering system — storefront, payment gateway, live order tracking and a complete admin back office.

What this project is

A complete online food store, built end to end — both the customer-facing storefront and the admin back office that runs it. A customer can find a product, pay for it with the method they already use, and watch the order move toward their door. The owner can add products, fulfil orders and read the day's numbers without touching a database.

Everything shown in the following pages is a working screen from the live application, not a mockup. Payments run through Midtrans, order status changes reach the customer instantly through Pusher, and product images are stored and served through Cloudinary.

FOR THE CUSTOMER

- Sign up with email verification, or one-tap Google sign-in
- Browse, filter by category and tag, search with pagination
- Cart that survives a refresh and a change of device
- Multiple saved delivery addresses
- Pay by card, e-wallet, virtual account, QRIS or convenience store
- Live order tracking and order history with invoices
- Star ratings and reviews after delivery
- Wishlist for products to come back to

FOR THE STORE OWNER

- Dashboard with revenue trend and best-selling products
- Full product management with image upload
- Low-stock alerts on the product list
- Order queue with a clear status workflow
- Category and tag management
- Instant notification when a payment lands
- Excel export of orders and order items
- Role-based access — customers never see admin screens

- ✓ Lacak pesanan secara real-time

New customers register with a name, email and password, or skip the form entirely with Google. Passwords are hashed with bcrypt before they are stored — the plain password never touches the database.

Registration does not grant access on its own: a verification email goes out through Nodemailer, and the account stays inactive until the link is opened. This keeps fake and mistyped addresses out of the customer list.

02

Sign in

Login screen with email/password and the Google alternative below it.

- ✓ Ratusan menu lezat tersedia
- ✓ Promo & diskon setiap hari

Credentials are validated on the server, and a successful sign-in returns a JWT that the browser keeps so the customer stays signed in between visits. Failed attempts return a single generic message rather than revealing whether the email exists.

The same screen serves both entry points — a returning customer and a first-time Google user land in the same place.

03

Google sign-in

Google's account chooser, handed off from the login screen. (A second account in this screenshot has been blurred for privacy.)

Google sign-in is handled by Passport's OAuth strategy. The interesting part is what happens on return: if the Google email already belongs to a registered account, the two are merged instead of creating a duplicate customer with a second order history.

Accounts created this way have no password of their own — page 13 shows how a customer sets one later if they want to sign in without Google.

04 Storefront

Home page: promo carousel, category icons, tag filters and the product grid.

Three ways to narrow down the menu, and they combine: category icons, tag pills, and the search bar at the top — all paginated so a long menu stays fast.

Each card carries the information that decides a purchase: price, average rating, review count, a low-stock badge when supply runs short, and a heart to save the product for later. Adding to the cart never leaves the page.

05

Shopping cart

The cart on desktop (left) and on mobile (right) — the same logic, two layouts.

The cart lives on the server, not only in the browser, so a customer can fill it on a phone at lunch and check out from a laptop that evening.

Items can be selected individually — the summary and the buy button follow the selection, so a customer can leave part of the cart behind without deleting it. Quantities adjust in place and the total recalculates immediately.

06 Checkout

Three checkout steps, and the confirmation email that follows.

Checkout is deliberately split into three short steps — review the items, pick a delivery address, confirm the total — with a progress bar so the customer always knows how much is left. Short steps abandon less often than one long form.

The final screen shows the full breakdown, including shipping, before any money moves. Once the order is placed, a confirmation email with the order number and item list is sent automatically.

07

Payment and live order tracking

The full journey, left to right: unpaid invoice → Midtrans payment methods → payment confirmed → processing → shipped → delivered.

Payment is handled by Midtrans, so the customer pays with what they already use — card, GoPay, ShopeePay, OVO, DANA, virtual account, QRIS or over the counter. Card details never pass through this application.

After payment the invoice becomes a tracker. Each stage the store moves the order through is pushed to the customer's open page in real time through Pusher — no refreshing, no "where is my order?" email. The final step hands the customer a confirm-receipt button and an invitation to rate what they bought.

08

Order history

Every transaction on the account, newest first, each with its payment status.

The screenshot displays the 'FoodStore' customer account interface. At the top, a red navigation bar contains the 'FoodStore' logo, a search bar with the placeholder 'Cari makanan, minuman, dan lainnya...', a shopping cart icon, and the user's name 'angga' with a dropdown arrow. Below the navigation bar, the user's profile is shown on the left, including a red circular avatar with the letter 'A', the name 'angga', email 'anggawika16@gmail.com', and 'Customer #2'. A sidebar menu lists options: 'Biodata Diri', 'Alamat Pengiriman', 'Wishlist', 'Riwayat Belanja' (highlighted in red), 'Keamanan', 'Belanja', and 'Logout'. The main content area features a yellow banner at the top stating '6 pesanan menunggu pembayaran'. Below this, the 'Riwayat Belanja' section is titled '20 transaksi tercatat' and displays a list of 20 orders. Each order row includes an order number, date, amount, and payment status. Orders are sorted by date, with the most recent at the top.

Order #	Date	Amount	Status
Order #44	21 Juni 2026	Rp 30.000	Lunas
Order #43	10 Juni 2026	Rp 30.000	Lunas
Order #42	10 Juni 2026	Rp 30.000	Lunas
Order #41	10 Juni 2026	Rp 30.000	Lunas
Order #40	10 Juni 2026	Rp 30.000	Lunas
Order #39	10 Juni 2026	Rp 30.000	Lunas
Order #38	10 Juni 2026	Rp 30.000	Lunas
Order #37	6 Juni 2026	Rp 45.000	Lunas
Order #36	6 Juni 2026	Rp 40.000	Lunas
Order #35	6 Juni 2026	Rp 40.000	Belum Bayar
Order #34	6 Juni 2026	Rp 40.000	Belum Bayar
Order #33	6 Juni 2026	Rp 50.000	Belum Bayar
Order #32	6 Juni 2026	Rp 75.000	Belum Bayar
Order #31	6 Juni 2026	Rp 60.000	Belum Bayar
Order #30	6 Juni 2026	Rp 50.000	Belum Bayar
Order #29	3 Juni 2026	Rp 30.000	Lunas
Order #28	3 Juni 2026	Rp 30.000	Lunas
Order #27	20 Mei 2026	Rp 30.000	Lunas
Order #26	20 Mei 2026	Rp 45.000	Lunas
Order #25	20 Mei 2026	Rp 30.000	Lunas

Paid and unpaid orders sit in one list, each labelled clearly, and any row opens the full invoice. The banner at the top counts the orders still waiting for payment and links straight to them — unfinished checkouts are recovered rather than forgotten.

09

Ratings and reviews

The rating dialog, opened from a delivered order.

Only a customer who actually received the item can rate it — the button appears on delivered orders, which keeps the ratings honest and blocks review spam from accounts that never bought anything.

A submitted rating recalculates the product's average immediately, so the score on the storefront card is always current. Comments are optional; stars are not.

10

Account profile

The account hub — profile details, with everything else one click away in the sidebar.

One place for the customer's own data: name, verified email, role, customer number and whether the account is linked to Google.

The sidebar is generated from the signed-in user's role. A customer sees the six entries shown here; an administrator sees an extra one — page 14.

11

Delivery addresses

Saved addresses, each with a label the customer chooses.

Customers keep as many addresses as they need — home, office, a relative's house — and pick one at checkout instead of retyping it every order.

New addresses are entered through a cascading form: province narrows the city list, city narrows the district, district narrows the village. The stored address is therefore a real, deliverable one rather than free text a courier has to interpret.

12

Account security

Password management, reachable from the account sidebar.

The screenshot shows the FoodStore user interface. At the top is a red header with the FoodStore logo, a search bar containing the text "Cari makanan, minuman, dan lainnya...", and a shopping cart icon. Below the header, on the left, is a vertical sidebar for the user "angga" (email: anggawika18@gmail.com, Customer #2). The sidebar contains links for "Biodata Diri", "Alamat Pengiriman", "Wishlist", "Riwayat Belanja", "Keamanan" (highlighted in red), "Belanja", and "Logout". To the right of the sidebar, there is a notification bar stating "6 pesanan menunggu pembayaran". Below this is the "Keamanan" section, which includes the instruction "Ganti password akun Anda". It features two input fields: "Password Baru" with the placeholder "Masukkan password baru" and "Konfirmasi Password" with the placeholder "Ulangi password baru". A red "Simpan Password" button is positioned below these fields.

Customers change their password here, with confirmation required so a typo cannot lock anyone out.

This screen also closes the loop on Google sign-in: an account created through Google starts without a password, and this is where the customer sets one — after which either method works. Losing access to the Google account no longer means losing the order history.

13

Admin entry point

The same account page seen by an administrator — note the extra sidebar entry.

There is no separate admin application to deploy and maintain. Administration is a role on the same account system: the Admin Panel entry only renders for users who hold it, and the server enforces the same rule with CASL, so a customer who guesses the URL is refused at the API rather than merely hidden from the link.

The banner at the top is the working queue — how many orders are waiting to be shipped right now.

14

Admin dashboard

Revenue, orders, catalogue size and customers, plus a 30-day trend and the top sellers.

The four cards answer the questions an owner asks first thing in the morning. Below them, a 30-day revenue curve and a daily order count show whether the trend is holding, and the top-products ranking shows what is carrying it — with units sold and revenue per product.

Charts are built with Recharts and read live figures from the order collection, so the dashboard never needs a manual update.

15

Order management

The order queue, filtered by status, with the next action on every row.

1-10 of 29 |< < > >|

Orders are counted by state at the top and split into tabs below, so the staff member handling shipments sees only what needs shipping. Each row offers exactly one next step — **Dikirim** on a processing order, **Diterima** on a shipped one — which makes the workflow hard to get wrong.

Every status change is pushed to the customer's screen in real time. **Export Excel** produces an order and order-item report for bookkeeping.

16 Product management

The catalogue table — image, price, category, tags and stock, all editable in place.

	Roti Pagi	Rp 25.000	utama	bread	4	Edit Delete
	Pizza	Rp 30.000	pastry	pizza	5	Edit Delete

Rows per page: 10 1-4 of 4 |< < > >|

The owner adds and edits products without a developer. Images upload straight to Cloudinary, so the store serves optimised images from a CDN instead of from its own server.

Stock counts turn into an amber warning when they fall below the threshold — the alert appears where the owner is already working, not in a report nobody opens. Categories and tags are managed on their own screens and feed the storefront filters shown on page 6.

LET'S BUILD SOMETHING

Thank you for reading

This project was built end to end — database, API, storefront, payment integration and admin back office. If you need something similar, or something quite different, I would be glad to talk it through.
